For growing communities:

- The DJ is responsible for educating the community about what good dance music is, by playing ONLY good dance music.
- The DJ may have to find creative ways to keep the energy flowing in young communities...but don't push it. When it's time to go home, go home. Trying to bring them back onto the floor may burn them out. After some time, they will gain interest & confidence and become "hardier" tangueros and will stay longer and dance with more energy. Be sensitive, not maniacal.
- Play familiar music - most newer dancers enjoy hearing familiar music. This is part of the "educational process".
- Play music to keep the majority of the people happy - you cannot satisfy everyone, and should NOT play music just to suit a minority of the community, in general.

For established communities & festivals

- Play for the dancers, not to show off your collection. Play a matrix of familiar music, and look for the opportunity to toss in some spice from time to time, but don't call too much attention to the "specials". Sometimes they're not necessary, especially in the first couple dances of a major festival - this is a good time to play familiar music so people from different places can connect in unfamiliar places within a matrix of familiar, comfortable music.
- Identify the dancers who are either the most experienced, have the most influence, etc. and make an effort to keep them dancing, in the hope that this will influence the others to keep dancing too. Caution is advised here - while identifying the major players, keep your eye on the overall crowd as a whole - this is merely something to be considered and balanced....
- Vary the music through the event to gradually build up to a climax, and if there is time (usually takes 4+ hours), a second climax is possible. The variables are speed of the song, emotional content, recording quality, and rhythmic complexity. There are other variables, but these are the big ones.

Special notes on sound equipment and volumes:

Use the highest quality sound equipment possible, and the fewest components possible. All that is needed is a source (CDs or computer), perhaps a mixer, an amplifier (unless the speakers are all powered), and speakers. An equalizer is very handy in the hands of an experienced technician; otherwise it often does more harm than good. Get the horns (tweeters) of the speakers at least 9' above the floor level, and higher IS better. This keeps the sonically tiring high notes out of the dancers' ears. As for volume, the goal is to set the sound system up to be able to play the lowest volume possible while still filling the room with full sound, allowing room to raise the volume, perhaps as the climax builds. Continual loud music causes sonic fatigue. Use the highest quality equipment possible, and get the horns of the speakers at least 9' above the floor.....have I said that already?? OK, DO it!!
